OpenShot is a popular, free, and [open-source video editor](#) available for Linux, Windows, and macOS. It offers a user-friendly interface and a wide range of features for basic to advanced video editing tasks.

In this article, we'll guide you through the process of installing OpenShot on your Linux system.

Method 1: Install OpenShot from Repositories

The easiest way to install OpenShot on Linux is through your distribution's official software repositories, which offer a stable version of the software and automatic updates through your package manager.

```
sudo apt install openshot-qt           [On Debian, Ubuntu and Mint]
sudo yum install openshot-qt           [On RHEL/CentOS/Fedora and Rocky/AlmaLinux]
sudo emerge -a sys-apps/openshot-qt    [On Gentoo Linux]
sudo apk add openshot-qt               [On Alpine Linux]
sudo pacman -S openshot-qt             [On Arch Linux]
sudo zypper install openshot-qt        [On OpenSUSE]
sudo pkg install openshot-qt           [On FreeBSD]
```

After the installation finishes, you can start OpenShot from your application menu or by typing `openshot-qt` in the terminal.

```
openshot-qt
```

Method 2: Install OpenShot from PPA

If your [Debian-based distribution](#)'s official repositories don't have the latest version of OpenShot, you can add the OpenShot developers' Personal Package Archive (PPA) to your system, which will give you access to the latest stable or daily builds of the software.

```
sudo add-apt-repository ppa:openshot.developers/ppa
sudo apt update
sudo apt install openshot-qt
```

Once the installation finishes, you can start OpenShot by clicking its icon in your application menu or by typing `openshot-qt` in the terminal.

```
openshot-qt
```

Method 3: Install OpenShot Using AppImage

If you prefer a more portable installation method, you can [download the OpenShot AppImage](#), whichs are self-contained, executable files that don't require installation and can run on [most Linux distributions](#).

Once the AppImage is downloaded, make the file executable by running the following command in your terminal.

```
chmod +x OpenShot-*.AppImage
```

Run the AppImage by double-clicking it or by executing the following command in your terminal.

```
./OpenShot-*.AppImage
```

The ApplImage will launch OpenShot without requiring any additional installation steps.
